

Market & Operating Evidence

A sourced view of the public peptide market, creator distribution, Biologix signals, operating gaps, and the systems required to convert demand into a durable company.

The demand is real. The durable advantage is the company built around it.

The public market is active, creator-led, operationally uneven, and far more dependent on distribution than custom technology. Biologix already appears to possess the scarce ingredients: founder authority, customer demand, supplier knowledge, creator access, and a recognizable brand. The remaining opportunity is to connect those assets through professional management, creator operations, lifecycle, finance visibility, fulfillment discipline, and reliable data.

The strongest commercial thesis is not “build another store.” It is to build an operating and distribution system around a brand that has already demonstrated unusual pull.

Thirty

Current seller candidates

Public research identified a broad U.S.-facing cohort with current retratutide-labelled or clearly mapped offers.

Eighteen

Brands compared deeply

Offer structure, acquisition, access controls, proof, retention, affiliate pathways, and public contradictions were compared.

Sixteen

Creator evidence rows

The verified register includes creators, tracked links, codes, public guides, communities, and other visible routing evidence.

Method boundary: No account was created, no purchase was made, and no private catalog or community was entered. Public storefront observations prove what was visible at a point in time—not product authenticity, customer outcomes, internal records, or regulatory clearance.

Distribution and trust do more work than the website.

The strongest observed operators use ordinary commerce infrastructure. Their sophistication comes from how they create trust, attribute demand, reduce purchase friction, retain customers, and restart the acquisition loop.

OBSERVED ACQUISITION PATTERN

Attention becomes trust before it becomes a transaction

- Search, social, podcasts, communities, and referrals create attention.
- Creator education, guides, articles, reviews, and founder identity create trust.
- Tracked links, personalized pages, and codes create attributable handoffs.
- Batch reports, support, shipping language, and visible policies reduce uncertainty.

OBSERVED RETENTION PATTERN

The transaction restarts the loop

- Email, SMS, account history, alerts, and replenishment offers support repeat purchasing.
- Membership, points, bundles, and broader catalogs deepen the relationship.
- Creator portals and partner management turn existing relationships into new acquisition.
- Wholesale and manager layers expand reach without routing every decision through a founder.

Creators often own the trust. The seller owns the transaction. The company that connects attribution, lifecycle, service, and management owns the durable relationship.

Observed funnel sequence

Attention → trust bridge → attributed handoff → product discovery → proof → access layer → transaction → fulfillment reassurance → retention → advocacy → expansion

The creator layer is already large enough to function as infrastructure.

Public evidence shows a mature creator-to-seller pattern: large audiences, education or community bridges, tracked links, codes, and portfolio relationships across multiple sellers. A link or code proves attributable routing—not payment, sales, exclusivity, or ownership.

CREATOR	PUBLIC REACH SNAPSHOT	OBSERVED ROUTING EVIDENCE
Clavicular / Braden Peters	Audience above one million on Instagram and near one million on TikTok at capture	Live creator-controlled route to Arcane; separate public reporting documented source promotion.
Connor Sinann	Large YouTube and TikTok audiences	Tracked vendor link, public code, public guide, and paid community funnel.
Zaytovenfit	Large TikTok audience	Live retatrutide-labelled creator route and separate tracked seller relationship.
Jesse Marji	Large TikTok audience	Live retatrutide-labelled source link and code, plus a second seller code.
Dymitri	Large TikTok audience	Current multi-vendor code portfolio, demonstrating that creators can operate across several relationships.
Sarah Westall	Established newsletter audience	Tracked links, personalized seller page, code, and a public partner program.

Identity caution: Public Connor Sinann must be confirmed as the same Connor discussed in the calls. Public Braden Peters is not Biologix founder Braden Lowder.

What the evidence supports Creators can supply trust, explanation, attributable traffic, community, and repeat exposure at meaningful scale.	What it does not support Public links do not prove private sales, relationship terms, exclusivity, conversion, or customer quality.
--	---

Public signals and founder-reported signals point to a company whose demand arrived before its infrastructure.

PUBLICLY OBSERVED

GLP-3R led the public popularity snapshot

The timestamped Biologix WooCommerce Store API snapshot returned GLP-3R / retatrutide first in popularity order. That order is sales-informed, but it does not disclose units, dollars, customers, or the represented period.

PUBLICLY OBSERVED

Visible storefront allocation was substantial

A timestamped public snapshot recorded 1,397 visible numeric units and approximately \$86,657 in displayed retail inventory across sellable entries. This is storefront allocation—not proof of total warehouse inventory, cost, ownership, or historical sales.

FOUNDER-REPORTED • NOT RECONCILED

A single dashboard view showed unusually high activity

During the recorded strategy call, Braden showed a dashboard amount of \$53,540.86 and 216 reported orders while explaining that analytics were incomplete and omitted Apple Pay. The screenshot is a strong operating signal, but it remains a founder-reported snapshot until matched to orders and settlements.

FOUNDER-REPORTED • TRANSCRIPT

Founder dependence is visible across functions

The calls describe founder-led fulfillment, a small active affiliate group, incomplete analytics, family-carried finance, and multiple growth initiatives waiting for a management layer.

Operating opportunities repeatedly identified in the calls

- Move finance knowledge from a family-carried process into independent professional coverage.
- Turn isolated creator relationships into a managed creator and affiliate system.
- Connect membership, subscription, email, SMS, referral, and retention into one lifecycle.
- Build managers who manage relationships and people without routing everything through Braden.
- Use retreats and creator experiences as recruiting, retention, content, and partnership infrastructure.
- Integrate PeptidePal as a strategic category asset rather than leaving it disconnected.

The market persists, but no single operating pattern proves durability.

OBSERVED PATTERN	PUBLIC EXAMPLES	WHAT THE EVIDENCE MEANS
Open direct store	American Peptides, Modern Peptides, Prime Peptides	Low-friction discovery and purchase; public claims and surrounding context are also easier to evaluate.
Qualified-access store	Skye, Xcel, Loti, Ion, Mile High	Access gates can collect purchaser representations and reduce public catalog exposure; they do not independently establish legal clearance.
Creator-to-coded offer	Connor → V&L, Clavicular → Arcane, Jesse → Peptira	The creator supplies meaning and trust while the seller closes the transaction.
Lifecycle-led commerce	Modern, American, Gentleman, Loti	Accounts, alerts, email, SMS, points, and replenishment mechanisms support repeat behavior.
Post-agency change	Several cited sellers	Observed responses include gating, renaming, copy changes, product removal, domain migration, continued public retail, and closure.

“Still online” is evidence of market persistence, not evidence that a disclaimer, access gate, code name, or creator separation has been accepted as a safe harbor.

Official records documented research-use-only sellers whose wider labeling and marketing led FDA to treat the products as drugs. Other official records documented sellers that later gated catalogs, removed cited products, migrated, continued publicly, or disappeared. A warning letter records FDA's concerns and an opportunity to respond; it is not a judicial finding.

Biologix does not need more disconnected tactics. It needs one accountable operating layer.

Creator operations

Recruiting, qualification, onboarding, content standards, attribution, communication, reporting, retention, and expansion should run through one system.

Management leverage

Managers should own portfolios and develop additional managers so growth creates leverage instead of more founder messages.

Lifecycle

Creator acquisition, membership, subscription, email, SMS, support, referral, and retention should share one customer view.

Finance visibility

Independent professionals should reconcile records and produce reliable reporting while the founders use that information to prioritize the company.

Quality and fulfillment

Product records, inventory movement, supplier documentation, complaints, and fulfillment performance require traceable owners and escalation paths.

Executive cadence

Every priority needs an owner, a status, a decision path, and a regular review so the company stops running through memory.

Partnership implication: Braden's highest-value work is founder vision, product authority, sourcing, brand, and relationships. Alex and OVO's highest-value contribution is building and managing the operating system around those strengths.

The evidence is strong enough to justify action—and disciplined enough to show what still needs proof.

Commercial records

- Order exports and product-level sales records
- Processor activity and bank settlements
- Refunds, disputes, and chargebacks
- Customer cohorts and repeat behavior
- Affiliate attribution and payout ledger

Company records

- Entity documents and ownership records
- Accounting close and tax records
- Material contracts and commitments
- Insurance and claims history
- Processor and platform agreements

Product and supply records

- Supplier and import documentation
- Inventory roll-forward and custody records
- Testing records and chain of custody
- Complaint and adverse-event records
- Fulfillment performance and exception logs

Operating records

- Current team and responsibility map
- Creator agreements and active roster
- Marketing and claims approval process
- Technology, data, and access inventory
- Current professional legal and regulatory advice

The purpose of diligence is not to slow the partnership down. It is to replace assumptions with a shared source of truth so both founders can move faster from the same facts.
